OPERATIVE REPORT

Patient Name: HART, ORA LEE
MRN: 1001456645
DATE OF PROCEDURE: 11/12/2019

ATTENDING PHYSICIAN: Brad Chauvin, MD

PREOPERATIVE DIAGNOSIS: Closed displaced comminuted fracture of the right patella.

POSTOPERATIVE DIAGNOSIS: Closed displaced comminuted fracture of the right patella.

PROCEDURE PERFORMED: Open reduction and internal fixation, right patella fracture.

ANESTHESIA: General.

ATTENDING SURGEON: Brad Chauvin, MD

RESIDENT SURGEON: Kaylan N McClary, MD-Resident

ESTIMATED BLOOD LOSS: 10 cc.

TOURNIQUET USED: 300 mmHg _____ to the right thigh initially for 11 minutes, then subsequently for 30 minutes with a different tourniquet machine due to tourniquet malfunction.

Encounter Notes (continued)

Op Note signed by Brad Joseph Chauvin, MD at 11/13/2019 6:47 AM (continued)

TOTAL INTRAVENOUS FLUIDS: 1 L

SPECIMENS: None.

IMPLANTS: Two 4.0 cannulated Synthes screws partially threaded with short threads were implanted with cerclage wire.

INDICATION FOR PROCEDURE: The patient is a 79-year-old female who approximately 10 days prior sustained a closed right patella fracture after a fall onto a flexed knee with concern for articular step-off. Discussed risks and benefits of surgical intervention. The patient elected to proceed with surgery.

DESCRIPTION OF PROCEDURE: The patient was seen and evaluated preoperatively. Correct surgical site was confirmed and marked. She was taken to the OR, underwent general endotracheal intubation. A time-out was performed, confirming correct patient, correct procedure, correct operative site. The leg was elevated, exsanguinated and the tourniquet was raised. A standard anterior knee approach was made by making a vertical incision just proximal to the superior aspect of the patella, extending distally down to the medial aspect of the tibial tubercle. It was sharply incised down to the level of the paratenon. A medial arthrotomy was performed with significant hemarthrosis evacuated. The joint surface was visualized and palpated with articular step-off. Point-to-point clamp and manipulation was performed with interval improvement in articular alignment. We then placed two parallel K-wires inferior to superior through the patella. Then, the tendon was incised just in line with the wire. A 4.0 cannulated drill bit was passed bicortically. The wires were measured and two short partially-threaded 4.0 screws were passed over the K-wires. The K-wires

were then removed and a cerclage wire was passed and then secured with a twisting fashion with the residual wire cut and then the end of the wire bent to reduce prominent hardware. Then, the surgical site was irrigated. The medial arthrotomy was closed with 0 Vicryl followed by closure subcutaneously with 3-0 Vicryl and skin closure with a running 3-0 Stratafix. The skin closure was reinforced with a Prineo and Dermabond followed by Aquacel dressing, ABD pads and cast padding, Ace bandage from the foot to the thigh to reduce edema. The patient was then placed into the knee immobilizer that she had presented with preoperatively and awakened from anesthesia, transferred to PACU in stable condition. The tourniquet was let down at closure and with adequate hemostasis confirmed.

Dr. Chauvin was present and scrubbed for all key portions of the procedure.

4.0MM 34MM - 4.0MM 34MM SYNTHES
LOG492969

Complications: Tourniquet machine had to be switched in middle of case due to disfunction

Findings: Interval reduction of articular surface and placement of hardware. Extensor mechanism intact.

Disposition: awakened from anesthesia, extubated and taken to the recovery room in a stable condition, having suffered no apparent untoward event.

Condition: doing well without problems

Technique: See Op note

Plan: PACU then home once outpatient criteria met
NWB RLE, continue KI at all times
Rx for pain medication
ASA 81mg for dvt ppx
RTC 2 weeks on Tuesday for wound check
Post op XR in PACU
Resume diet
